

Day-6

1. WAP to initialise a character array or String in a multiple way and print (from user and hardcoded using for loop and get()).
2. WAP to use predefined length function and your own length function for array.(get array from user).
3. WAP to your own string copy function and concat it , print the copied and concated string.
4. Write a function for string reverse and check it reversed string and original string is same or not.
5. WAP to get 2 strings from user and compare that with case ignore(write your on string compare function with ignore case).
